

Project XP Leveling System Version 1.0

Overview

Version 1.0 introduced the foundation of the XP Leveling System. The goal was to create a simple, linear progression system where the player gains XP, levels up, and sees their stats update accordingly.

Core Features

XP Gain System

- The player earns XP from battles or events. XP accumulates until it reaches the threshold for leveling up.

Level-Up Logic

- When XP meets or exceeds the required amount, the player levels up and excess XP carries over.

XP Threshold

- A fixed amount of XP (100) is required per level.

Stat Display

- A simple `show_stats()` function prints the player's current level, XP, and XP needed for the next level.

Key Functions

- `gain_xp(amount)` — Adds XP and handles leveling.
- `xp_to_next_level()` — Calculates remaining XP needed.
- `show_stats()` — Displays current player stats.

What Version 1.0 Achieved

- A working XP system
- Clean, readable output
- A stable foundation for future upgrades

Version 1.0 was all about **building the core loop** that every RPG needs.
